

OTAS[®] Service

The solution for the maintenance of plant components

Service Functions

Service is a tool for the preventative maintenance of plant components. The components are categorised as follows; valves, pumps, sensors and control devices, electrical and mechanical components. The required maintenance jobs can be compiled into a maintenance schedule and printed out. Related components are collected into maintenance groups. Through a manufacturer-specific division of the maintenance schedule, orders can be generated from one corresponding component list.

Performance Data

- View and print due maintenance jobs.
- Time based maintenance planning.
- Division by manufacturer, plant area, or maintenance group.
- New components added from the real-time database or from external files.
- Generate and print orders.
- Individual adjustment of component lists with additional seals and wearing parts.
